

Q catheter, said bag-like element being in the form of a flat film when not holding a fluid inside and in the form of a tube when holding a fluid inside, and the inside film and outside film that compose said bag-like element are partially and directly joined.

---

A2 5. (amended) The therapeutic appliance according to claim 3 wherein a spring material that applies force to at least the leading edge and rear edge of the bag-like element so as to wrap around the catheter in the free load state, is arranged so as to be perpendicular to axis of the catheter.

6. (amended) The therapeutic appliance according to claim 1 having an additional film on the outside of the bag-like element, said additional film composes a space that allows the holding of fluid inside with the outside film that composes the bag-like element.

---

Please add new claims 7-11 as follows:

---

A3 --7. (new) The therapeutic appliance according to claim 4 wherein a spring material that applies force to at least the leading edge and rear edge of the bag-like element so as to wrap around the catheter in the free load state, is arranged so as to be perpendicular to axis of the catheter.

8. (new) The therapeutic appliance according to claim 2 having an additional film on the outside of the bag-like element, said additional film composes a space that allows the holding of

fluid inside with the outside film that composes the bag-like element.

9. (new) The therapeutic appliance according to claim 3 having an additional film on the outside of the bag-like element, said additional film composes a space that allows the holding of fluid inside with the outside film that composes the bag-like element.

10. (new) The therapeutic appliance according to claim 4 having an additional film on the outside of the bag-like element, said additional film composes a space that allows the holding of fluid inside with the outside film that composes the bag-like element.

11. (new) The therapeutic appliance according to claim 5 having an additional film on the outside of the bag-like element, said additional film composes a space that allows the holding of fluid inside with the outside film that composes the bag-like element.--
